

Two methods, one value

Name: _____ Date: _____ 12 minutes

Show your thinking with calculations, words, or labeled models. Use the same-sized whole in every fraction model.

1. Solve $\frac{1}{4} + \frac{2}{5}$ using twentieths and again using fortieths. Explain why the answers have the same value.

2. Write two different pairs of positive fractions with unlike denominators that add to $\frac{3}{4}$. Prove each pair works.

3. Explain why adding the denominators does not count equal-sized parts. Use one of your calculations as evidence.
